

Dear Hiring Manager,

Financial markets generate enormous volumes of data every second. Transforming that data into reliable decisions requires not only powerful technology but engineers who can think critically, build scalable systems, and solve complex problems under pressure. This is exactly the type of environment that motivates me, which is why I am excited to apply for an Engineering opportunity at Goldman Sachs.

Currently pursuing a Master of Data Science at RMIT University, I enjoy building systems that convert raw data into meaningful insights. Recently, I developed a machine-learning based banking fraud detection system designed to analyse transaction patterns and identify high-risk activity in real time. I also built a financial analysis assistant capable of processing financial datasets and generating analytical insights that support decision-making. These projects strengthened my ability to work with large datasets, design predictive models, and translate technical outputs into practical solutions.

What excites me most about Goldman Sachs Engineering is the opportunity to work on technology that operates at the scale and speed of global markets. The firm's focus on scalable software, low-latency infrastructure, and data-driven decision making reflects the kind of engineering challenges I am eager to contribute to.

Beyond technical work, I bring a collaborative mindset and adaptability developed through my experience balancing academic work with customer-facing roles. Working in fast-paced environments has strengthened my communication skills and ability to solve problems quickly while working with diverse teams.

I am particularly drawn to Goldman Sachs because its engineers are not only building technology, but shaping the infrastructure that powers modern finance. I would welcome the opportunity to contribute my analytical mindset, curiosity, and engineering skills to that mission.

Thank you for your time and consideration.

Sincerely,

Amogh Bandadi Mohan
